

the-year-1000-trading-script

This script is for [theyear1000](#) from fiverr.

The main idea

is a simple trading script for Binance in Python. When it is run it will take in a list of Buy and Sell signals for FIVE assets and make trades based on that

Requirements

1. Connect to Binance API
2. Get account balance. USDT, BTC, BCH, ETH, XMR, DASH
3. Read in CSV file, get LAST ROW of csv.
4. 1 = BUY Take 20% of the account in USDT and purchase that asset
5. 0 = SELL Sell full amount of that asset for USDT

How to run the script

Please run the following commands in your terminal

Create venv

```
python3 -m venv /path/to/new/virtual/environment
```

Activate venv

```
source /path/to/new/virtual/environment/bin/activate
```

Install dependencies

```
python3 -m pip install -r requirements.txt
```

Exit out

```
deactivate
```

Now It's Time to run the script

```
/path/to/new/virtual/environment/bin/python3 /path/to/script/trade_script.py "/path/to/file/input.csv"
```

Notes:

1. You will find a log file with the operations logged in it in `/path/to/script/logs`.
2. After we take 20% of your account value the "USDT" the value will be rounded to 8 decimal places, because most of the trading pair will not accept the order unless we do that for example `1234.384728374847` after round will be `1234.38472837`.
3. I'm using `python 3.8.5` please use this version or higher.
